

Client Project 3: Above and Beyond

- To make the User Interface look professional, I have tried using different color combinations to make it look better and attractive.
- I have used different techniques for displaying data to the user such as; when a user clicks on the faculty/staff button, a new window will appear which will give information much more in detail.
- Programming in C# was quite challenging as I did not have much knowledge about this language. But with resources available on the internet such as the documentation and stackoverflow, much of my work become easier.
- I have tried displaying information on a customized window when user clicks on a particular control (button, label etc.).
- I have reused the existing code where it was possible. For example, in the faculty/staff section, I did not have to write new lines of code for each faculty and staff section as much of the code in this section was redundant.
- In the contact form section, I am fetching the form directly from the IST page.
- The program calls API only once when it is needed.
- I have tried covering all the APIs in some or the other way.
- There were lot of different controls used while developing this application, so I used to forget the names of each control. Trying to figure out the names of each of them was little complicated and specially time consuming.
